

IHS Towers provides the infrastructure necessary for today's wireless and telecommunications networks to function throughout Africa.

With **six different business models** to suit different needs, we are connecting Africa.

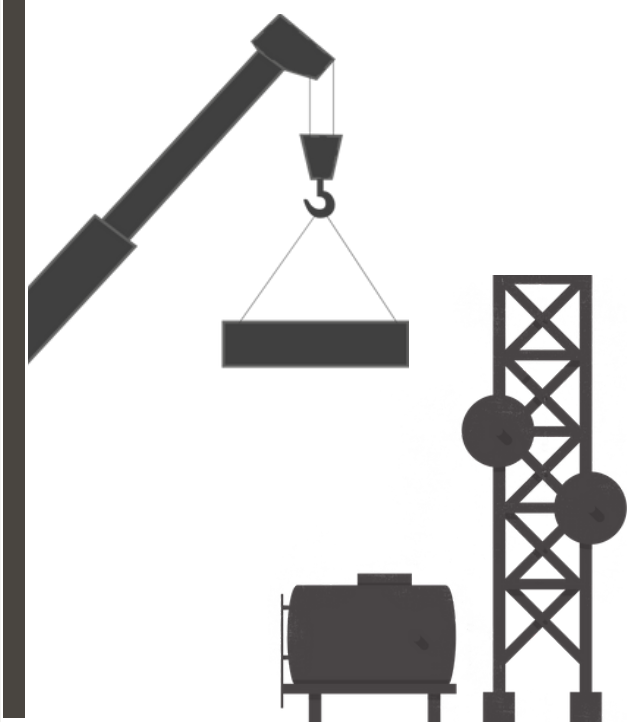

Colocation

Colocation is the sale of space and services on an existing tower to a mobile services provider needing point-to-point secure communications.

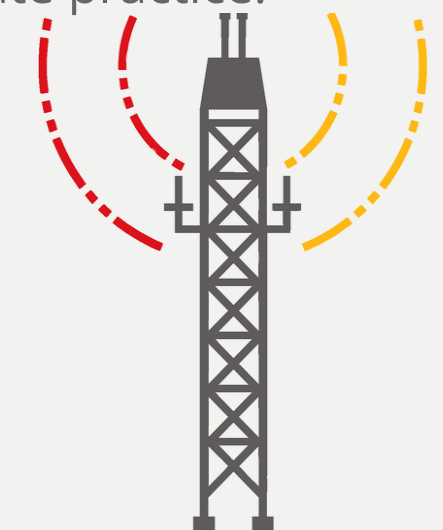

Build-to-Suit

Our team of Site Development Project Managers handles every step of the project to build a site specific to an operator's requirements and then manage that site.

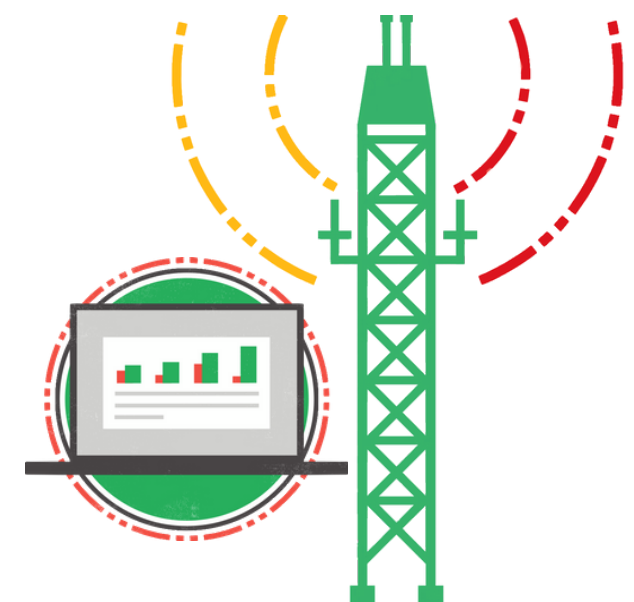

Buy-Lease-Back

We buy network operator's towers and lease space, and provide services back to them. This frees up their capital and allows them to expand their network quickly. Plus, they know they're getting best-in-class service and up-to-date practice.

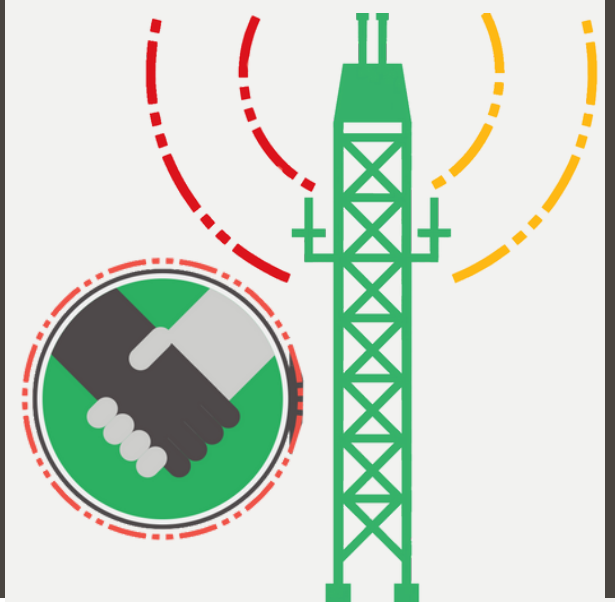

Managed with License to Lease

We have the authority to lease out space on a tower owned by a third party and manage shared resources. Tower owners reduce their operating costs, eliminate capital expenditure and secure a better quality of service.

Managed Services

We offer a full suite of services to manage any tower site, which we can tailor to our customers' needs -- all with the aim of reducing operating costs and capital expenditure and improving quality.

Inbuilding Solutions

Connected solutions for large buildings, offices and complexes require more robust mobile services. IHS provides an efficient and discreet way of creating better coverage for operators indoors.
